**Treasures in a map (2)****P60796\_en**

---

Write a program that, given a map with treasures and obstacles, computes the distance from a given initial position to the nearest accessible treasure. The allowed movements are horizontal or vertical, but not diagonal.

**Input**

Input begins with the number of rows  $n > 0$  and the number of columns  $m > 0$  of the map. Follow  $n$  rows with  $m$  characters each. A dot indicates an empty position, an 'x' indicates an obstacle, and a 't' indicates a treasure. Finally, two numbers  $r$  and  $c$  indicate the initial row and column (both of them starting at 1) where we must start looking for treasures. You can assume that  $r$  is between 1 and  $n$ , that  $c$  is between 1 and  $m$ , and that the initial position is always empty.

**Output**

Print the minimum number of steps to reach a treasure starting from the initial position. If no treasure is accessible, tell so.

**Sample input 1**

```
7 6
..t...
..XXX.
.....
tX..X.
.X..Xt
.XX...
..t...
5 3
```

**Sample output 1**

```
minimum distance: 4
```

**Sample input 2**

```
4 10
..t...X...
.....X..t.
XXXXX.X...
.....X..t
4 1
```

**Sample output 2**

```
no treasure can be reached
```

**Sample input 3**

```
5 7
.....
.XXXXXt
.X...Xt
.X.X.XX
...X.Xt
5 5
```

**Sample output 3**

```
minimum distance: 19
```
